Emergency Medical Technician Psychomotor Examination Spinal Immobilization (Seated Patient)

Date:	Candidat	e: Examiner:					
Directs Assistant to place/maintain head in the neutral, in line position Directs application of manual stabilization of the head Reassesses motor, sensory, and circulatory functions of each extremity Applies appropriately sized extrication collar Applies appropriately sized extrication collar Applies appropriately sized extrication collar Positions the immobilization device appropriately Secures the device to the patient's torso 1 Evaluates torso fixation and adjusts as necessary 1 Secures the patient's head to the device Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Date:	Start Time:	End Time:				
Directs Assistant to place/maintain head in the neutral, in line position Directs application of manual stabilization of the head Reassesses motor, sensory, and circulatory functions of each extremity Applies appropriately sized extrication collar Positions the immobilization device appropriately Evaluates torso fixation and adjusts as necessary 1 Evaluates and pads behind the patient's head s necessary 1 Secures the patient's head to the device Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention							
Directs application of manual stabilization of the head Reassesses motor, sensory, and circulatory functions of each extremity 1 Applies appropriately size extrication collar Positions the immobilization device appropriately Secures the device to the patient's torso 1 Evaluates torso fixation and adjusts as necessary 1 Evaluates and pads behind the patient's head s necessary 1 Evaluates and pads behind the patient's head s necessary 1 Evaluates and pads behind the patient's head s necessary 1 Evaluates and pads behind the patient's head s necessary 1 Evaluates the patient's head to the device 1 Evaluates moving the patient to a long backboard 1 Reassesses motor, sensory, and circulatory functions of each extremity 1 TOTAL 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Takes or Verbalizes appropriate body substance isolation				1		
Reassesses motor, sensory, and circulatory functions of each extremity Applies appropriately sized extrication collar Positions the immobilization device appropriately 1 Secures the device to the patient's torso 1 Sevaluates torso fixation and adjusts as necessary 1 Secures the patient's head to the device 1 Secures the patient's head to the device 1 Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention COMMENTS	Directs Assistant to place/maintain head in the neutral, in line position				1		
Applies appropriately sized extrication collar Positions the immobilization device appropriately 1 Secures the device to the patient's torso 1 Evaluates torso fixation and adjusts as necessary 1 Evaluates and pads behind the patient's head s necessary 1 Secures the patient's head to the device 1 Evaluates moving the patient to a long backboard 1 Reassesses motor, sensory, and circulatory functions of each extremity 1 Fotal 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria 1 Did not immediately direct or take manual stabilize of the head 2 Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement 1 Torso fixation inhibits chest rise, resulting in respiratory compromise 1 Upon completion of immobilization, head is not in a neutral, in line position 1 Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device 2 Failure to manage the patient as a competent EMT 2 Exhibits unacceptable affect with the patient or other personnel 3 Uses or orders a dangerous or inappropriate intervention 1 COMMENTS	Directs application of manual stabilization of the head				1		
Positions the immobilization device appropriately Secures the device to the patient's torso Secures the device to the patient's torso Evaluates torso fixation and adjusts as necessary Evaluates and pads behind the patient's head s necessary 1 Secures the patient's head to the device 1 Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity 1 TOTAL 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention COMMENTS	Reassesses motor, sensory, and circulatory functions of each extremity				1		
Secures the device to the patient's torso Evaluates torso fixation and adjusts as necessary 1 Evaluates and pads behind the patient's head s necessary 1 Secures the patient's head to the device Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention COMMENTS	Applies appropriately sized extrication collar				1		
Evaluates torso fixation and adjusts as necessary Evaluates and pads behind the patient's head s necessary Secures the patient's head to the device Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Positions the immobilization device appropriately				1		
Evaluates and pads behind the patient's head s necessary Secures the patient's head to the device Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilizatioin Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Secures the device to the patient's torso				1		
Secures the patient's head to the device Verbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Evaluates torso fixation and adjusts as necessary				1		
Nerbalizes moving the patient to a long backboard Reassesses motor, sensory, and circulatory functions of each extremity TOTAL 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilizatioin Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Evaluates and pads behind the patient's head s necessary				1		
Reassesses motor, sensory, and circulatory functions of each extremity TOTAL 12 You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	Secures the patient's head to the device				1		
You must factually document your rationale for checking any of the above critical items on this form (below or turn sheet over). Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention COMMENTS	Verbalizes moving the patient to a long backboard				1		
Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilizatioin Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention COMMENTS	Reassess	es motor, sensory, and circulatory	functions of each extremity		1		
Critical Criteria Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention							
Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention	You must	factually document your rationale fo	r checking any of the above critical it	tems on this form (below or t	urn sheet ov	er).	
Signature	Did not immediately direct or take manual stabilize of the head Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization Released or ordered release of manual stabilization before it was maintained mechanically Manipulated or moved the patient excessively causing potential for spinal compromise Head immobilized to the device before device sufficiently secured to the torso Patient moves excessively up, down, left, or right on the device Head immobilization allows for excessive movement Torso fixation inhibits chest rise, resulting in respiratory compromise Upon completion of immobilization, head is not in a neutral, in line position Did not reassess motor, sensory, and circulatory functions in each extremity after immobilizing patient to the device Failure to manage the patient as a competent EMT Exhibits unacceptable affect with the patient or other personnel Uses or orders a dangerous or inappropriate intervention
